INTRODUCTION

This book contains listings for games written in BASIC for the TRS-80 COLOR COMPUTER made by Radio Shack.

You probably know from your owner’s manual that the question mark (?) is a short way of typing in PRINT. You can save time by using it when you are typing in these programs.

Remember, accidents do happen;

DEBUGGING

After typing in a program and SAVEing it, the TRS-80 may have trouble RUNning it. This happens when copying a program from paper to computer. Check that you entered all the program lines completely. A common problem is the famous SYNTAX ERROR. If you get one, list the program line on the screen. Compare it to the book listing. You will probably see one of these problems:

1. Spelling error, or
2. Punctuation error (brackets, commas, colons or semi-colons missing), or
3. The number zero confused with the letter ‘O’ (or vice versa), or
4. The number one confused with the letter ‘T’ (or vice versa).

Fix it and try RUNning the program again. It may take several attempts to get all the errors out, but the work will be worth it. Remember to SAVE a final copy that has all the corrections made.
FASTER PROGRAMS

The games in this book are pretty fast, but as you master them you may find them more challenging if they were faster. There are two ways to make the games faster.

The first method is to add these lines to any of the programs:

1. IF PEEK(&H3EB9) ⊕ &H32 THEN CLEAR200, &H3EB0:FOR I=&H82B9 TO &H831E:POKE I-&H4400, PEEK(I):NEXT ELSE 5
2. FOR I=0 TO 2:POKE &H3EBD+I, 18:NEXT:I=&H3F1E
3. POKE 1,&H26:POKEI+1,3:
   POKEI+2,&H7E:POKEI+3,&H83:
   POKEI+4,&H22:POKEI+5,&H7E
4. POKE I+6,&HA4:POKEI+7,&H4C

Adding the above lines will disable the break key, which speeds the games up. To break out now you must use the reset button.

Another way to speed things up is to enter this line before RUNning a program:

POKE 65495,0

This line nearly doubles the speed of the Color Computer. You will notice even the sound speeds up. Before doing any disk or tape access you must press reset or enter this line:

POKE 65494,0

EXPERIMENT

If you have some programming knowledge, do not be afraid to try changing the games. After each program description is a list of what the program variables are used for.

And remember, there is nothing that you can enter into the TRS-80 by program or through the keyboard that can do any permanent damage. If something goes wrong, you can either turn the TRS-80 off and on to begin again, or press the RESET button.
You have just left Phobos, one of the two moons of the planet Mars, and now you must land on Deimos, the other moon. But landing here isn’t an easy task. You must navigate your moonshuttle through a deadly asteroid field. Using your four thrusters, U to go up, J to move right, H to move left and N to go down, you can maneuver through your descent and avoid the asteroids. To keep track of your fuel and energy consumption, read-outs of this information are given periodically.

SPACE DUEL

By Scott McCann
You are trapped outside your space capsule and someone is firing at you. The situation is desperate; you have only seven shots. This could be your last stand. To move up and down use the joystick or keys Q and A respectively; fire with W. If you are playing against a second player, they use the keys P and ; to move up and down; O fires. If both players run out of shots, the game is declared a draw.

**VARIABLES USED:**

- A,B,C — arrays to hold shapes
- A,B — left and right joystick values
- A$, W$ — temporary strings
- C — computer play flag
- D — difficulty
- LC, LZ — left player laser coordinates
- LU, RU, SU — capsule, left and right player direction vectors
- LX, RX, SX — capsule, left and right player coordinates
- P2 — check joystick buttons
- RQ, RZ — right player laser coordinates
- SL, SR — laser fire flags
- SS — ship shot flag

Alien Attack and the other games in this book make use of DATA statements. Why DATA statements instead of variables? Because DATA statements can hold information that is not needed all at once or information that is needed only once.

The directions that the ships must move are stored in DATA statements at the end of the program. The program variables are used to hold information that is required very often; for example, the score and score counter (SC and CS).

To use DATA statements in your own programs type “DATA” followed by the information you want stored. Separate each piece by commas.

For example:

100 DATA 8,10,20,-17

Strings may be stored this way too. If a string has punctuation or spaces in it, the string must be enclosed in quotes; otherwise, the computer will not know where it ends.

For example:

105 DATA FRED,SCORE,BOX, "CATS AND MICE",LASER

Numerical and string information may be stored in the same DATA statement (up to a total of 88 characters).

For example:

110 DATA 255,210,-22,"FUEL SUPPLY IS ",ELEPHANT,89

If you have more information to store, simply start a new DATA statement.

To retrieve the information stored in a DATA statement, the BASIC command READ is used. To find out more about READ statements, turn to page 27 in this book.
PROTECTOR

by L. Braine
You are on an intercept mission near the surface of Neptune. Only you and your ship stand between the space colony and the attacking aliens. They come in swarms of four at a time. Can even your valiant ship keep up this deadly pace? If you can ward off the aliens for two minutes, the colony will be saved. Good luck!

ALIEN ATTACK
Adapted by Scott McCann
by Peter Lear
You await your doom inside the crippled space station. The aliens will be attacking in clusters. There are eight different ways that they can get in. When they do come, the station's force shields will protect you from at least three blasts on each side. Then, if you're lucky, you will figure out how to operate the malfunctioning laser cannon and fight back. There are several controls that could do it – your joystick and some keys. Try T, Y, U, G, J, B, N and M. Maybe by destroying enough attackers you will be able to recharge your shield and save the space station and your life.

Note: Try pressing H, C and other keys after the game.

Variables Used:

- A,B: joystick positions
- A,B,C,D: arrays to store shapes
- J,H: enemies' laser positions and status
- J: shots factor
- L: joystick flag
- M,N: arrays with enemy ship status
- S,C,CS: score counters
- U,V: player's firing direction
- W,WS: general purpose counters
- X,Y: bullet position
- XX,YY: enemy ship positions

810 DATA -5,-5,0,-5,5,-5,5,0,5,5,0,5,-5,5,-5,0
820 DATA 5,6,7,8,1,2,3,4
To retrieve the information stored in a DATA statement, the BASIC command READ is used. It is followed by one or more variables separated by commas. READ takes the first piece of information from the first DATA statement and puts it into the variable that follows the READ statement. If there is a second variable, the next piece of information is taken from the same DATA statement and put into the second variable. This continues until all the variables following the READ statement are filled. If everything from the first DATA statement is read, the computer automatically jumps to the next one.

There must be as many pieces of information in your DATA statements as are to be READ. The variable type (string or number) must match the type of information being READ. Here is an example using the DATA statements from page 17:

120 READ N
This line reads the number 8 from the DATA statement in line 100 and puts it in the variable N.

130 READ A,B,C,D$,E$,F$,G$
This line reads all the information in line 100 and some from 105. Notice how the string variable reads string information and the number variables read numbers.

140 READ H$,I,J,K,L$,M$,O
This line reads all the remaining information in lines 105 and 110. If information in a DATA statement does not match the type being READ, you will get a "TYPE MISMATCH" error.

When two commas follow one another without any information between them, a READ statement will take this as either an empty string or the number zero. Here is an example:

150 DATA 10,20,"15,GREG",6,7
160 READ G,H,I,J,K$,L$,M,N,

This program gives the variables the following information:

G=10
H=20
I=0
J=15
K$="GREG"
L$=""
M=6
N=7

When a DATA statement has been totally READ, another READ command will result in an "OUT OF DATA ERROR." To avoid this, always match up the number of pieces of information with the number of variables that will READ them.

The RESTORE command will allow you to use the DATA statements again.
You have penetrated the enemy planet's refueling station. You must pilot your spacecraft through the cavern that houses the fuel dump. The terrain is rough and changes radically. Be very careful; the survival of your planet depends on you. Use the Arrow keys to move your ship left, right, up and down; the greater and less than signs fire left and right and the space bar fires down. Try not to hit the walls as that costs points. Good hunting!

**VARIABLES USED:**

- B,C: random number
- C$: keyboard input
- CC,DD: cave width multiplying factors
- CO: wall color
- G,J: right and left walls
- I,IV: vertical shot counter and direction orientation
- JO: joystick flag
- K: counter
- M,N: ship position
- P,PP: stores status of cell in front of ship
- Q,Z: joystick position
- S: score
- U: ship direction orientation

he future of your planet is in your hands. Yours is the last alpha base left; 
everything else has been destroyed by the Astrol Fleet. You 
can still defeat the warring aliens, but it will take skill and cunning on your 
part. Only one multi-directional laser is still operational, but due to a 
computer malfunction, you cannot move the laser and fire it at the same 
time. Z moves your base left, X moves it right; , moves your turret left 
and . moves it right. Fire your laser 
with the space bar. Remember, 
existence as you know it depends on 
you. Good luck!

Every game starts in the same place... in someone's head. The idea is then put down on paper. All the features the game will have are written down. Pictures of the various characters and backgrounds are drawn. Every rule and aspect of the game is included in this paper plan.

The next step is to put all this information into an order of events. On another piece of paper shapes are drawn and each event of the game is put in a box, circle or diamond. Then, with each figure a brief note of purpose is made. The name of this series of shapes and notes is a flowchart.

Every event in the flowchart is a small program in itself. These small programs are commonly called subroutines. Breaking all the events into subroutines makes the task of programming the game much easier. Tracing a flaw in a particular subroutine is easier than tracking one down in a long, unco-ordinated program.

Quite often subroutines can be used more than once. They can even be transferred from one game to another. There is no point in designing a new subroutine to examine which way a player has moved the joystick for every game using a joystick. By using some of the same subroutines from game to game, a programmer will save himself or herself a lot of time.
Here are some guidelines to follow when designing a game:

1. Write down your ideas.
2. Draw up a flowchart.
3. Use subroutines.
4. Use the same subroutines where possible.

The game SPACE DUEL started with these ideas:

- two players will be dueling in space
- each player can move up and down
- each player has seven shots
- some objects will be placed on the screen to provide temporary protection.
- there will be a one-player option to play the computer
- the computer will have unlimited shots

These ideas were then summarized in a flowchart. The shapes in the flowchart mean:

- START
- CALCULATE
- MAKE A DECISION
- INPUT or OUTPUT
- STOP
Here is a flowchart for SPACE DUEL

start

draw title screen

create men, ship and asteroids

initialize variables

check keyboard

move UFO

move player one

fire

no

player one # shots?

no

move player one

yes

player one to fire

no

is computer playing

is computer to fire

move
two to move

fire

no

did shot hit player two?

no

yes

is computer to fire

move computer
to fire

fire

no

did shot hit player one?

no

yes

move two to move

fire

no

did shot hit player two?

no

yes

move both players out of shots

yes

stop

42
Here is a verbal description of how the game **SPACE DUEL** works:

<table>
<thead>
<tr>
<th>Line numbers</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>10</td>
<td>build arrays</td>
</tr>
<tr>
<td>20 - 110</td>
<td>instructions</td>
</tr>
<tr>
<td>120</td>
<td>play music</td>
</tr>
<tr>
<td>130 - 250</td>
<td>set up and draw graphics</td>
</tr>
<tr>
<td>260 - 280</td>
<td>input game variables</td>
</tr>
<tr>
<td>290</td>
<td>set up some variables</td>
</tr>
<tr>
<td>300</td>
<td>branch to line 400 if using keyboard</td>
</tr>
<tr>
<td>310 - 390</td>
<td>joystick check</td>
</tr>
<tr>
<td>400 - 460</td>
<td>keyboard check</td>
</tr>
<tr>
<td>470 - 540</td>
<td>main loop</td>
</tr>
<tr>
<td>550 - 560</td>
<td>move left man</td>
</tr>
<tr>
<td>570 - 580</td>
<td>move right man</td>
</tr>
<tr>
<td>590 - 620</td>
<td>left man shoots</td>
</tr>
<tr>
<td>630 - 670</td>
<td>right man shoots</td>
</tr>
<tr>
<td>680 - 700</td>
<td>move capsule</td>
</tr>
<tr>
<td>710 - 770</td>
<td>computer control loop</td>
</tr>
<tr>
<td>780 - 810</td>
<td>end of game</td>
</tr>
</tbody>
</table>

By examining the ideas, the flowchart, the listing description and the program listing itself, you will be able to see how Space Duel fits together. You may follow these same steps when creating games of your own. **HAVE FUN!**
Another title from this series:

FANTASTIC GAMES FOR THE TRS-80
will give you hours of computer fun and entertainment.
